Practical Week-2 **Kamtam Priyanka, 2520090001**

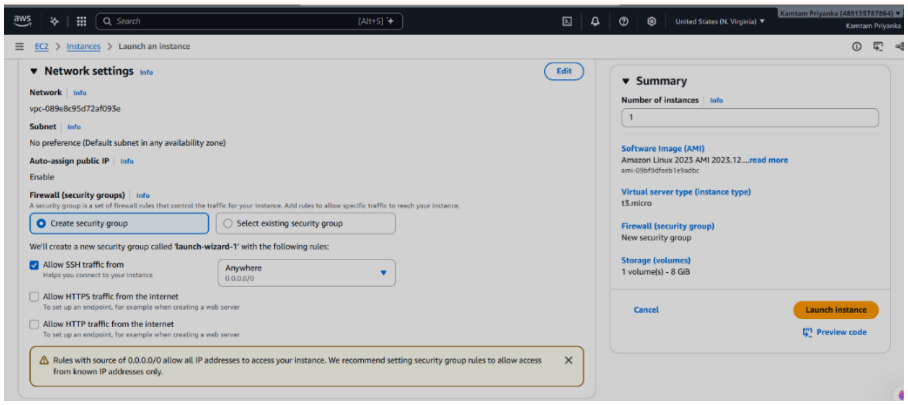

1. Linux Virtual Machine Creation

Step-wise procedure:

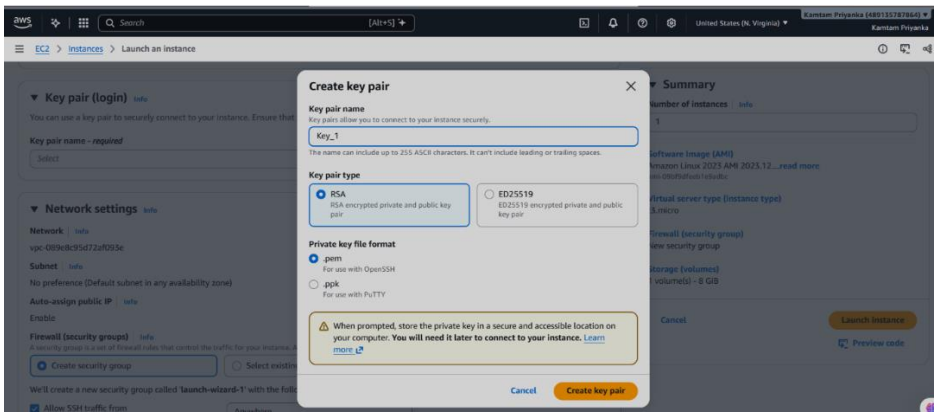

1. Click on launch instance.
   Name it as – My_Linux_Virtual_Machine
   Choose application – Amazon Linux

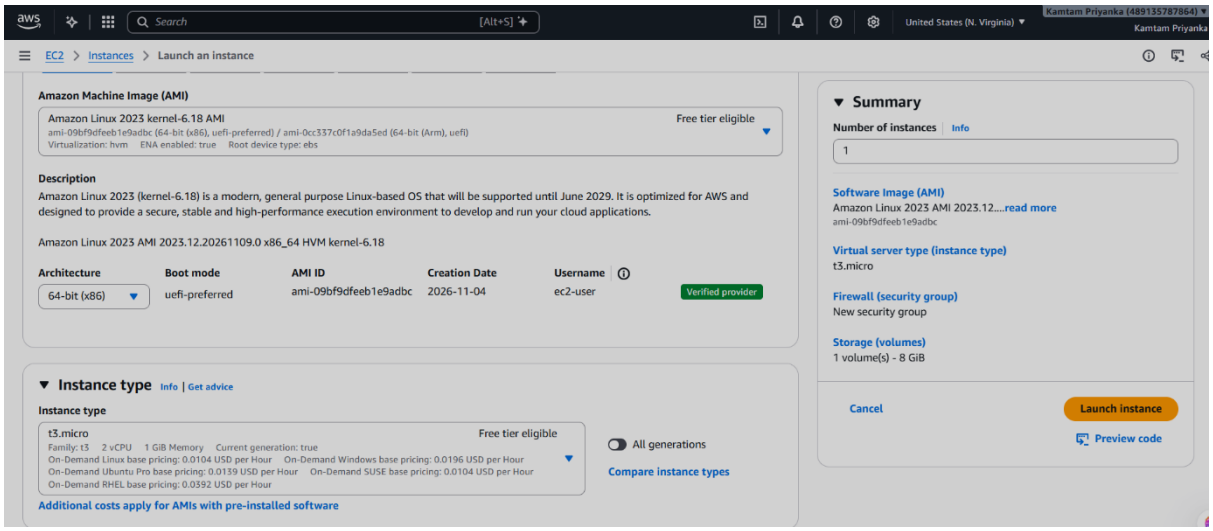

2. In network settings select – Allow SSH traffic from anywhere

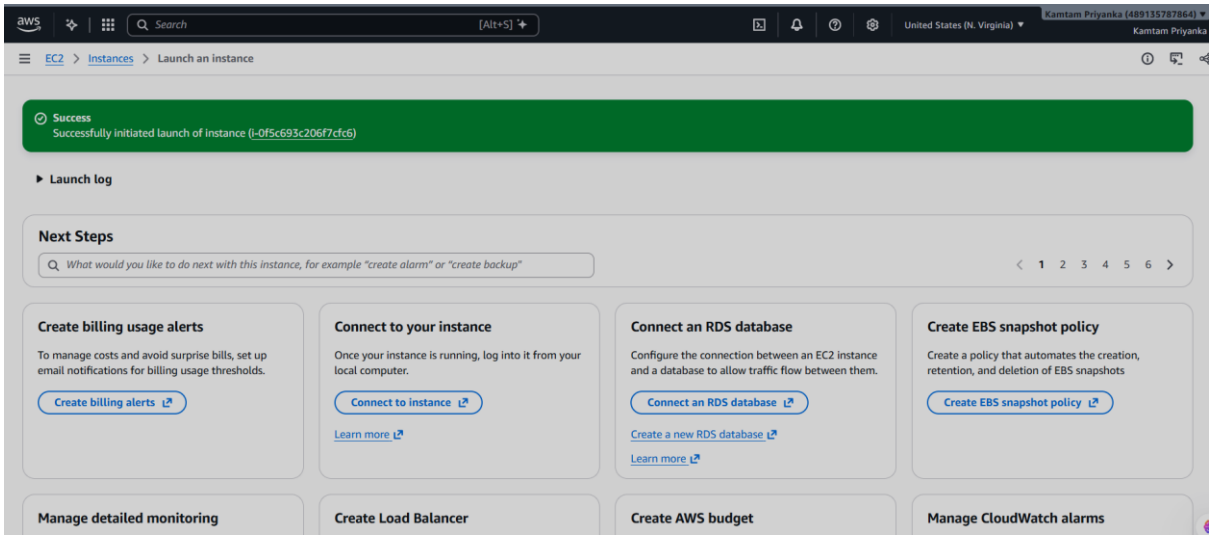

3. Create a new key pair
   Name the key as – Key_1
   Keep the default selected options as it is same

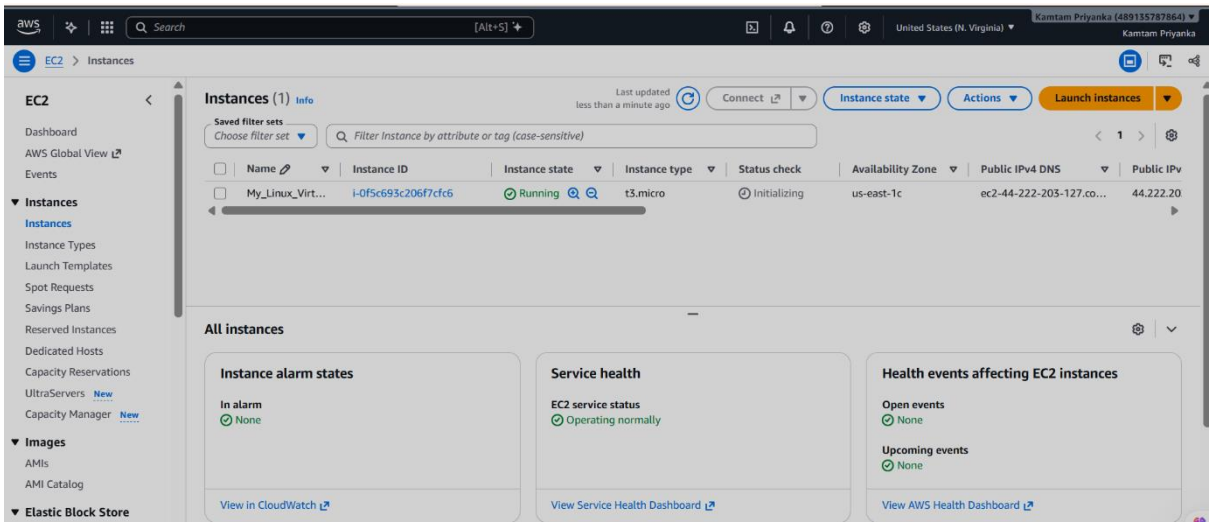

4. Keep the other default options the same way and launch instance

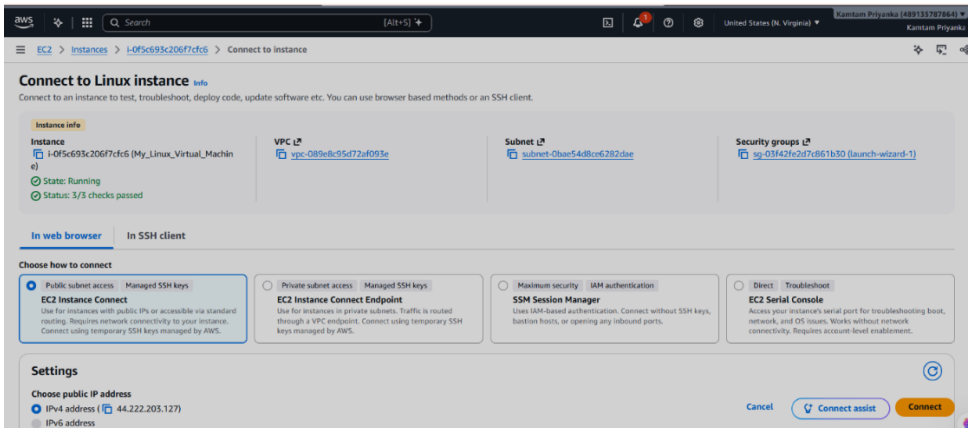

5. Instance is launched

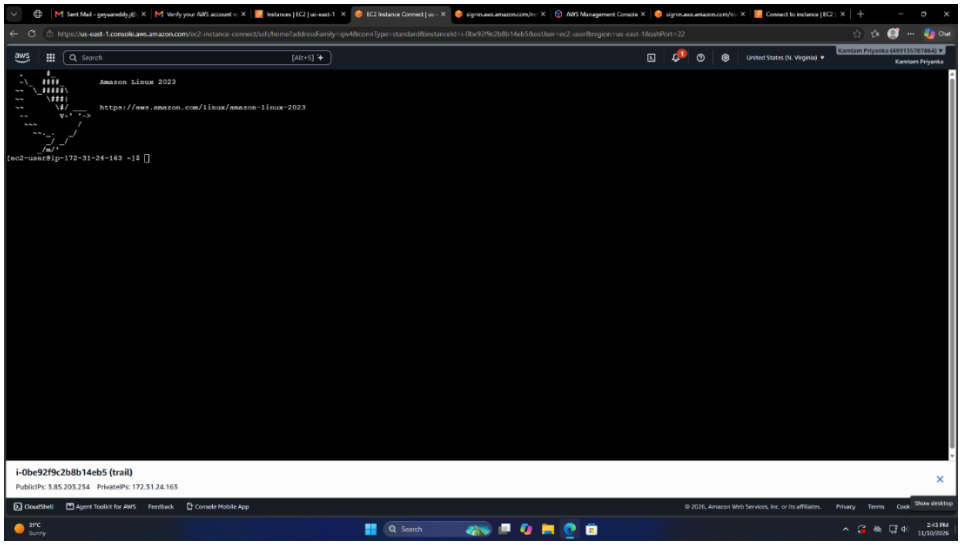

6. Come back to instance page and select the instance to connect

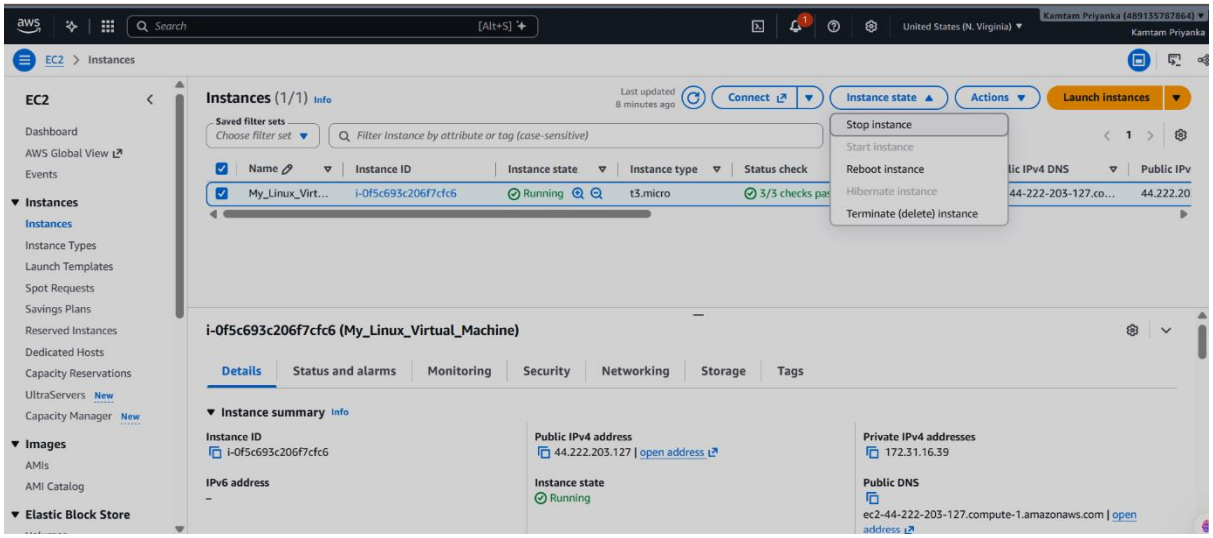

7. Choose EC2 Instance Support and IPv4 and connect

8. Linux Virtual Machine is created

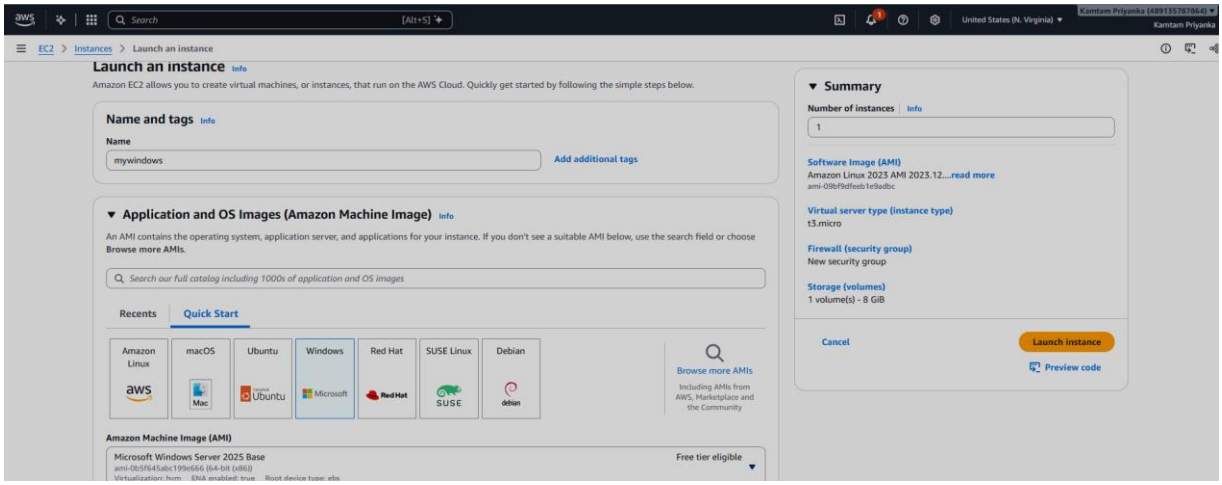

9. Stop the instance after done or terminate it

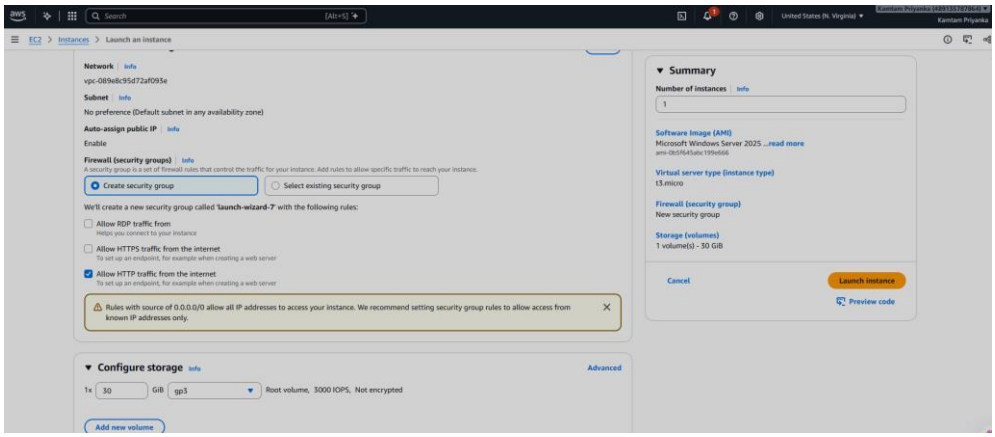

Task – 2 Windows Virtual Machine Creation

Step-wise procedure:

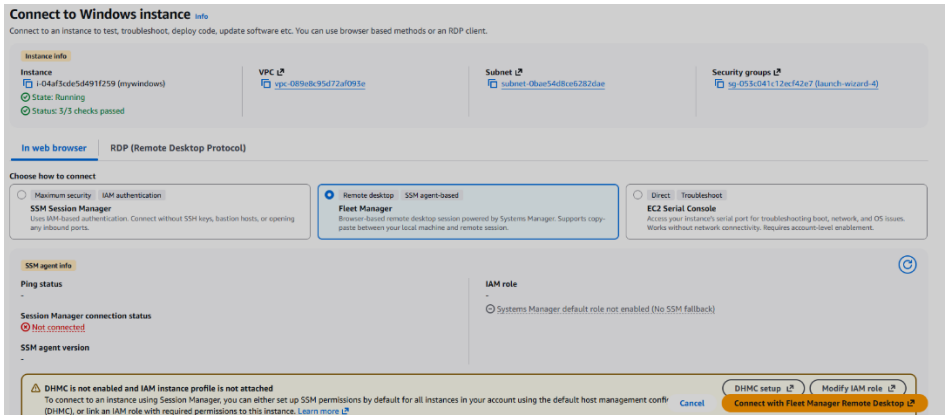

1. Click on launch instance.
   Name it as – mywindows
   Choose application – Windows

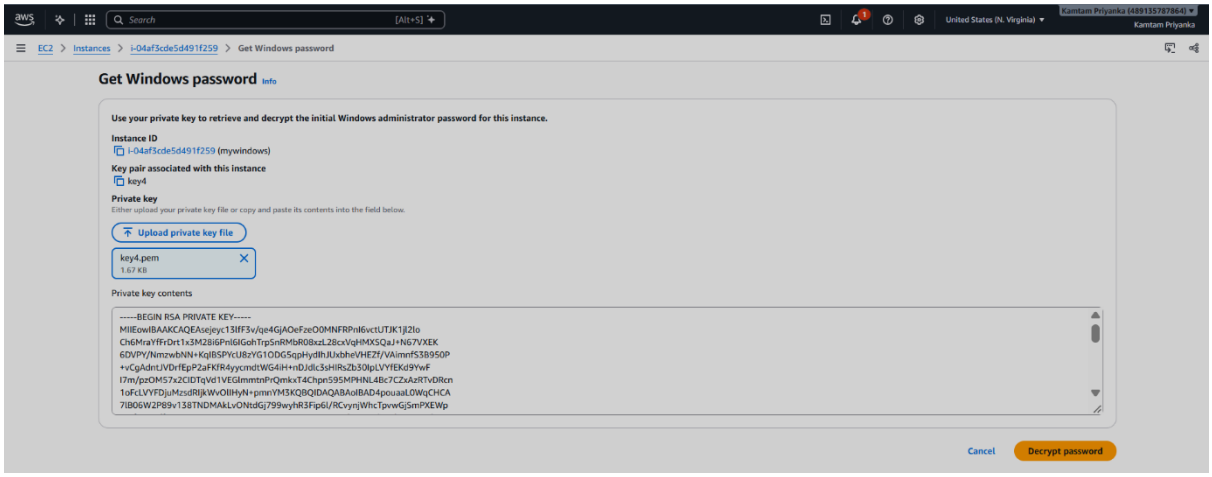

2. Under network choose HTTP to launch wizard and remaining to be left as default

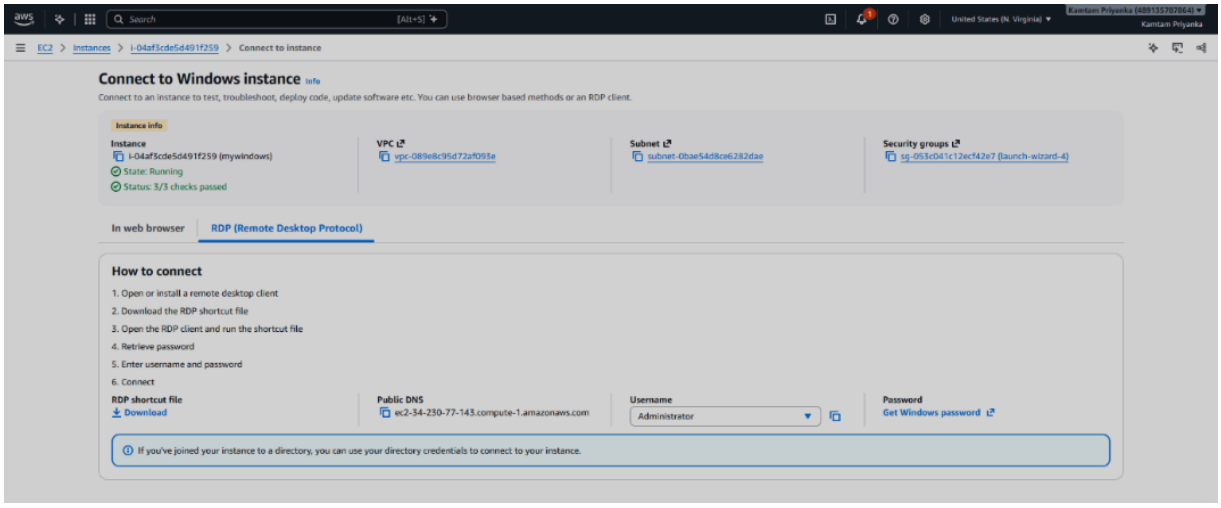

3. After launching the instance, connect it.
   Choose Fleet Manager under web browser.

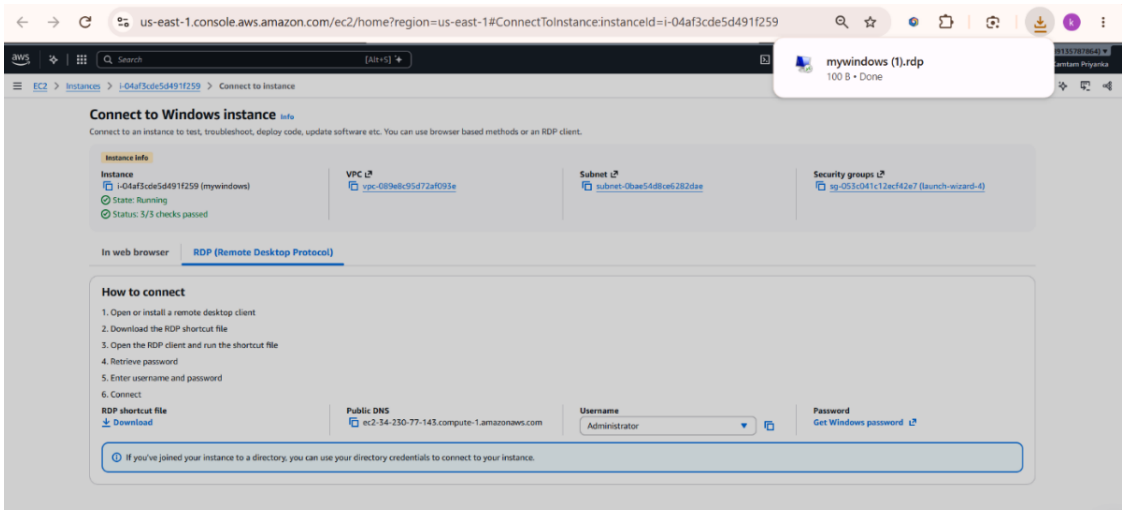

4. Click on Get Windows Password to move to new windows.
   Upload the key created for this instance and decrypt the password to make it short and copy it.

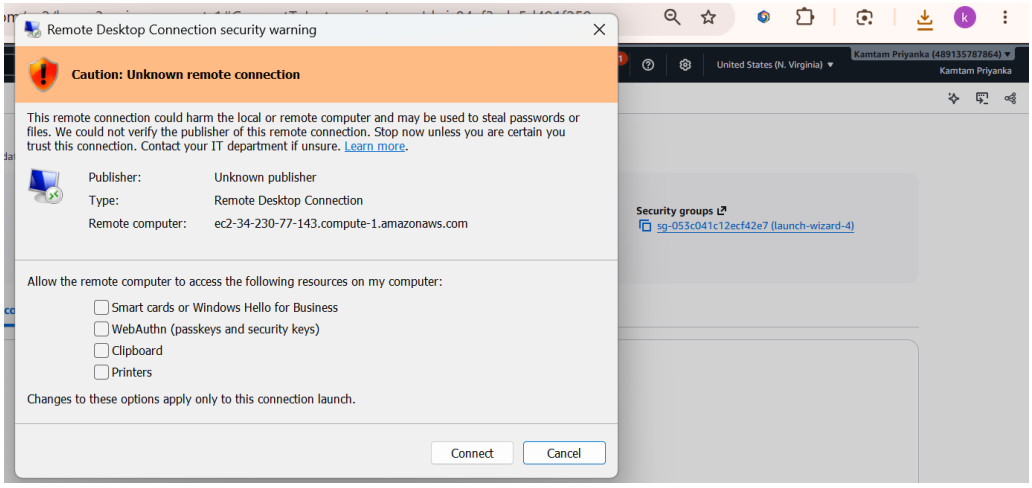

5. After copying and saving above you will be navigated to instances.
   Now click on connect again and choose RDP.

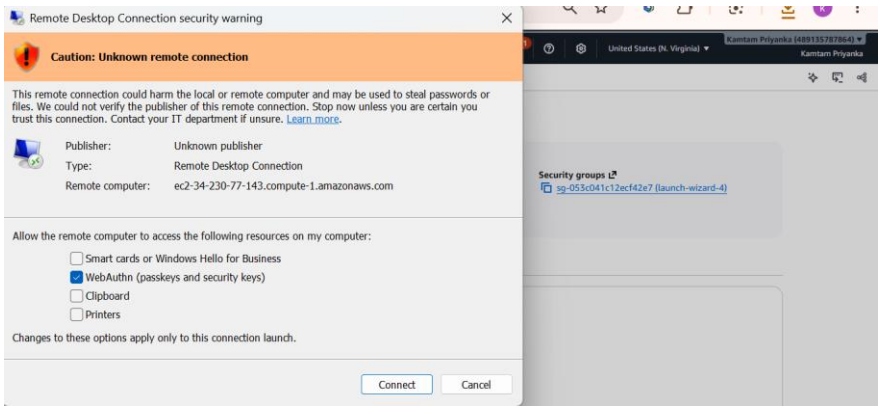

6. Download the RDP shortcut file and open it.

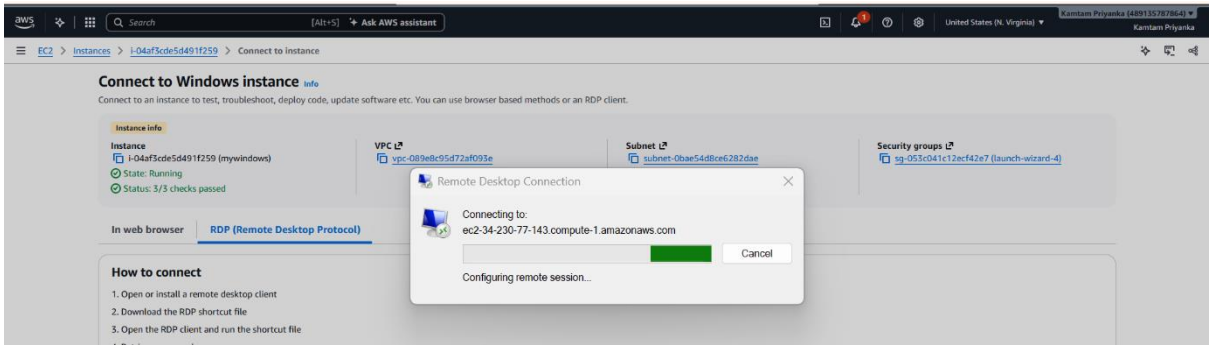

7. After viewing the zip it shows as below.

8. Choose WebAuthn and connect it.

9. It then asks for the password, paste the password copied under get windows password instead section.

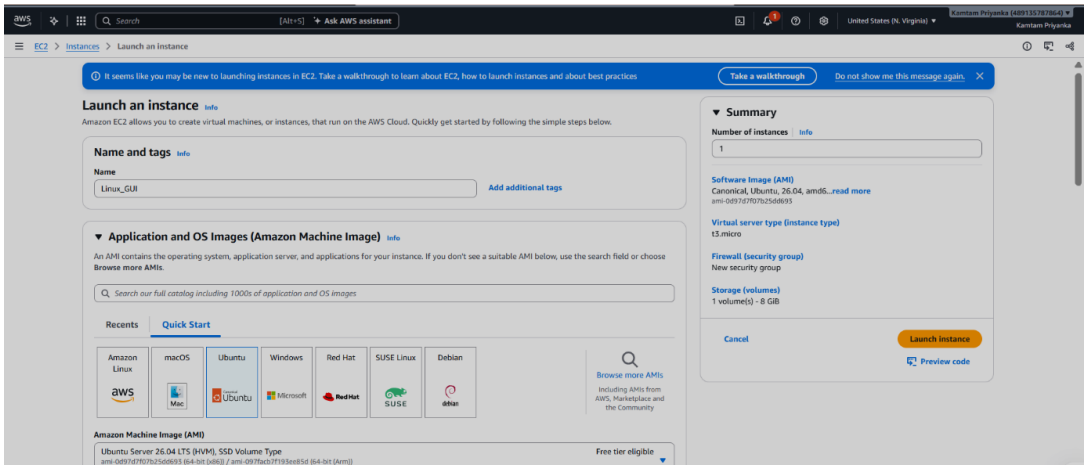

10. This connects to a new window of other IP address and displays a new window that may be of any location. The window displayed will be in the server.

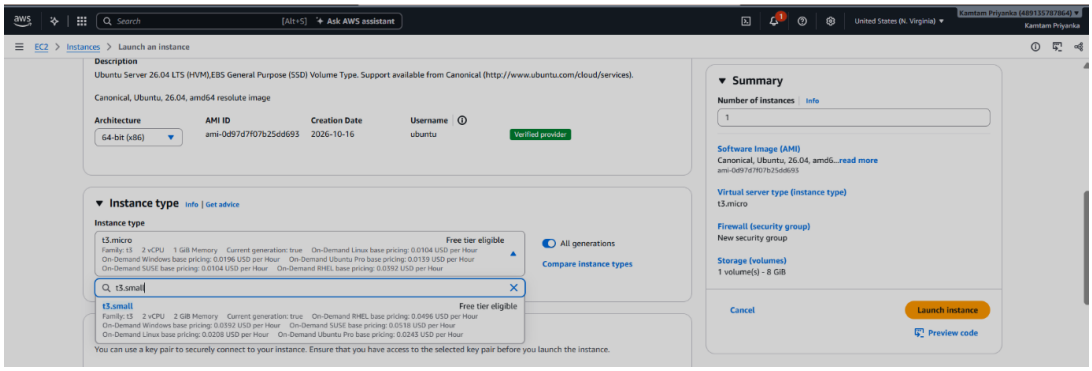

Task – 3 Linux GUI Creation

Step-by-step procedure:

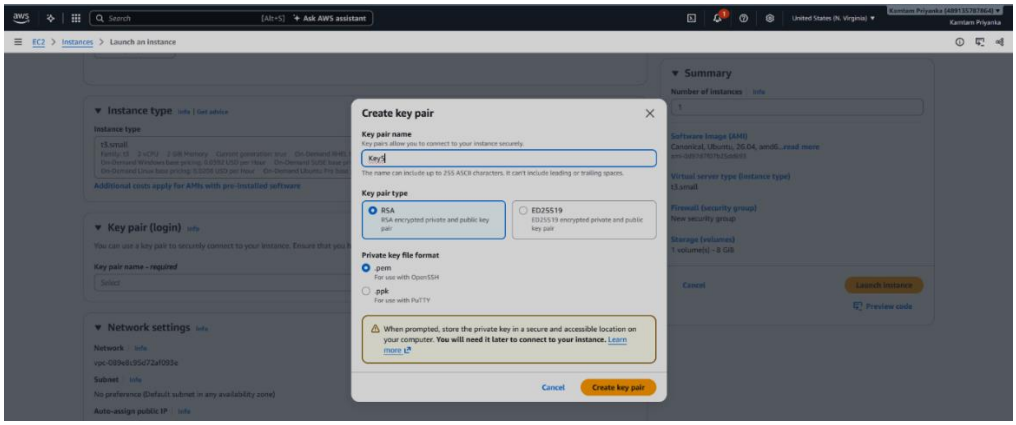

1. Launch an instance
   Here I named as – Linux_GUI
   Choose application as - Ubuntu

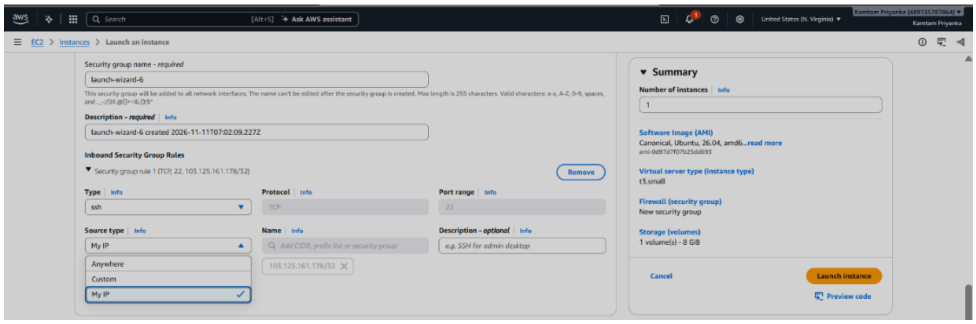

2. Choose instance type as t3.small

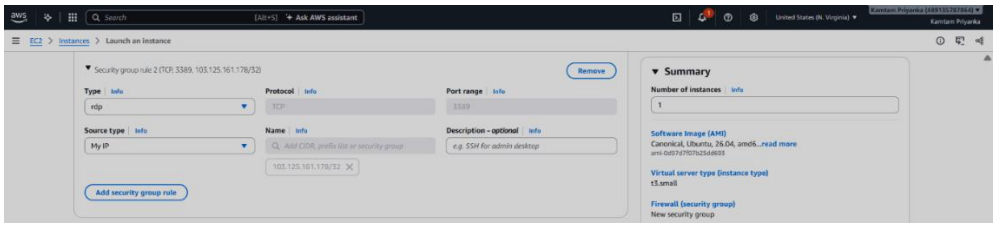

3. Create a key pair
   Here I named key as Key5

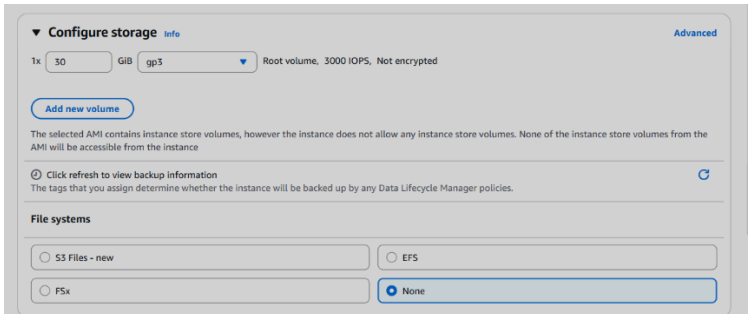

4. Under Inbound Security Group Rules choose Source Type as My IP

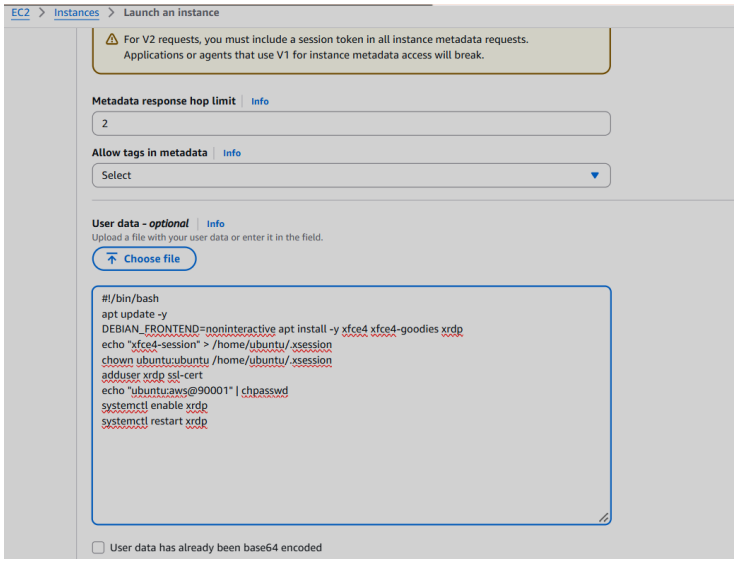

5. Add another security group as choose type as rdp and source type as My IP

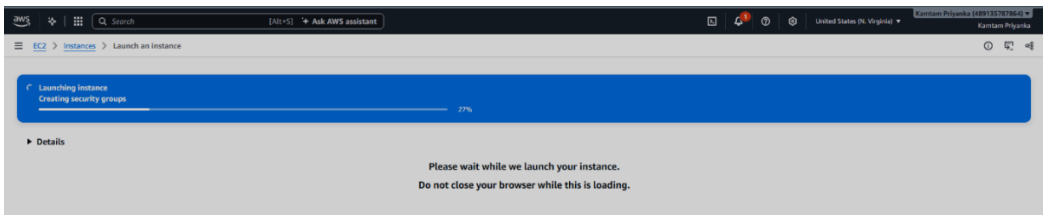

6. Configure storage to 30 GiB

7. Code below the required code for Linux GUI under user data

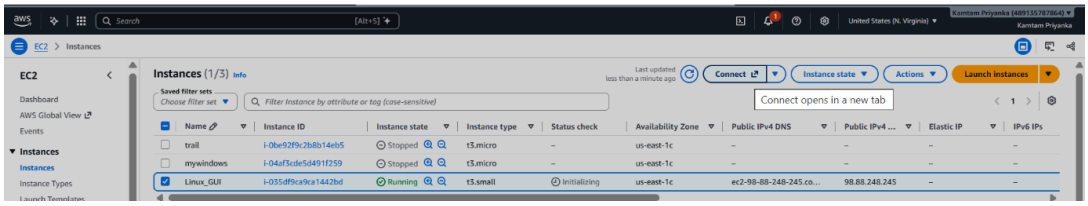

8. Launch Instance

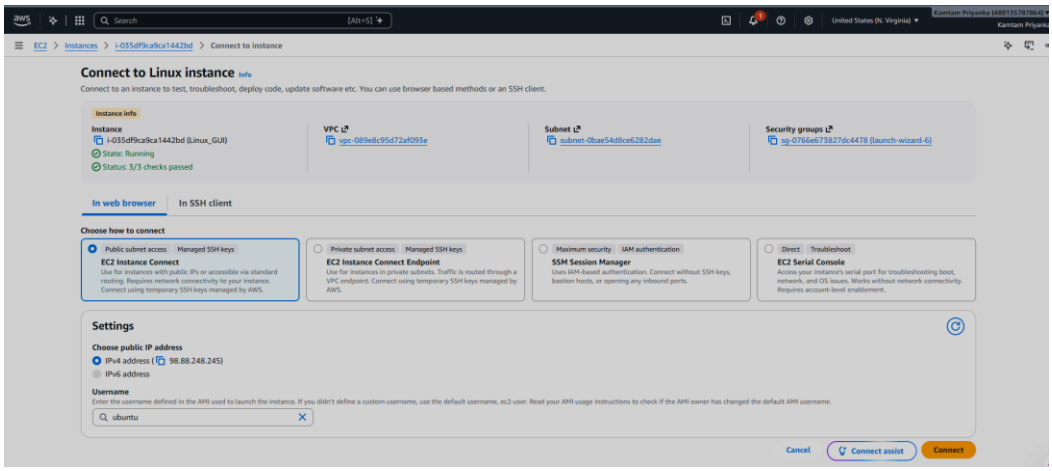

9. Successfully launched instance

10. Click on instance and connect

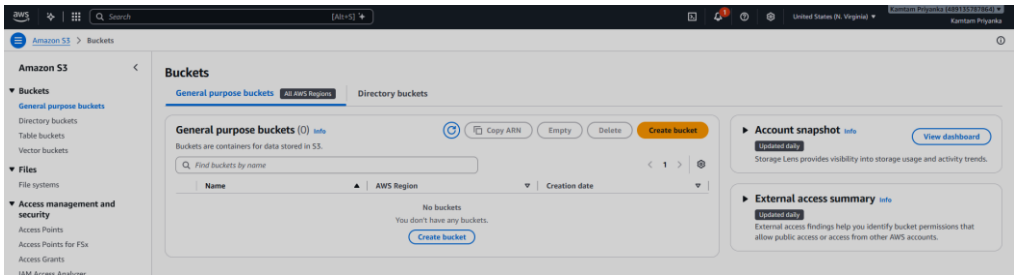

11. Choose EC2 Connect in web browser and IPv4 address

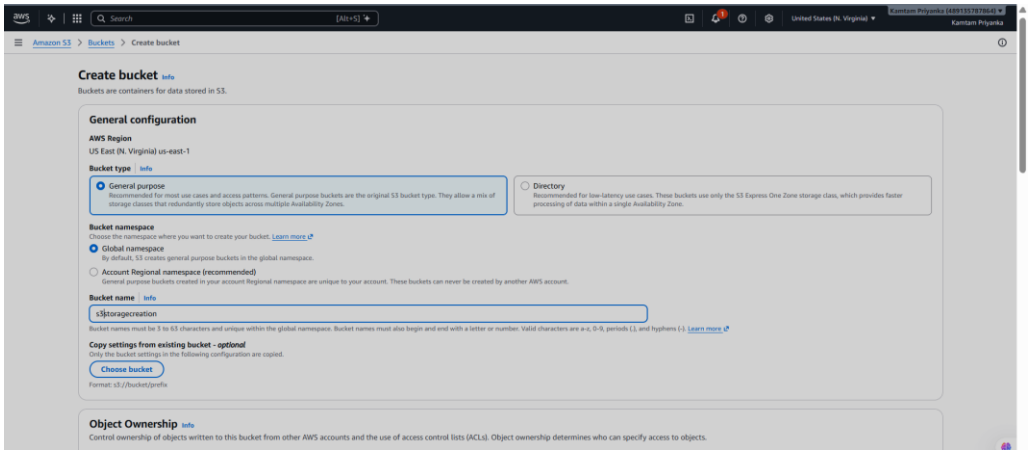

Task– 4 Storage Creation using S3

Step-by-step procedure:

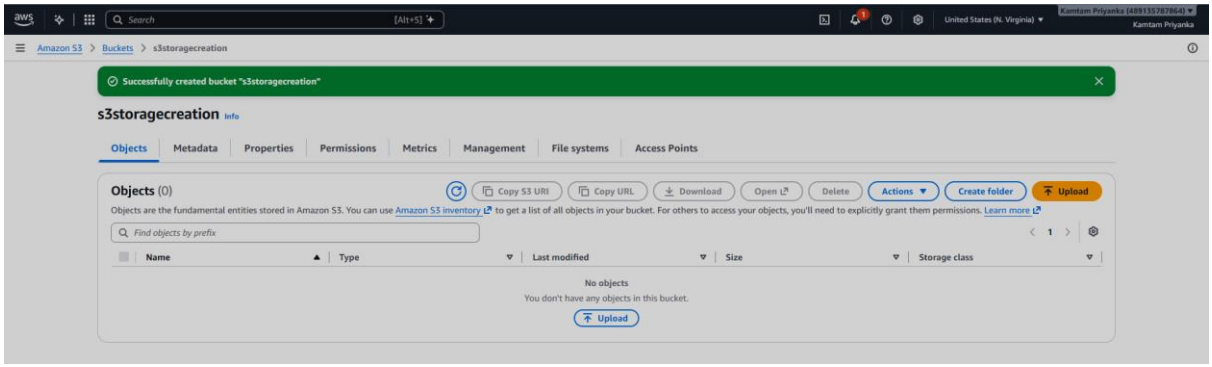

1. In console search for S3 choose Bucket and create a bucket

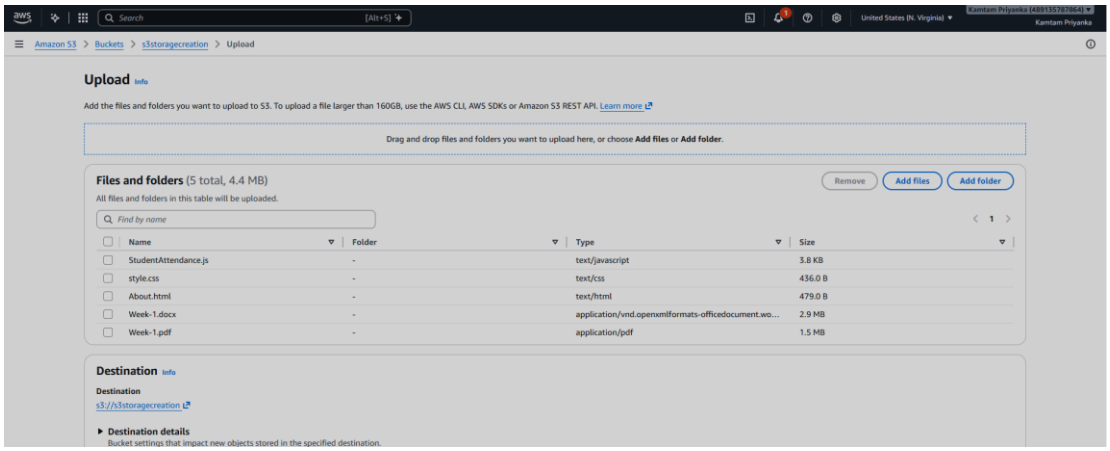

2. Keep the default selected options the same and name the bucket, here I named as – s3storagecreation

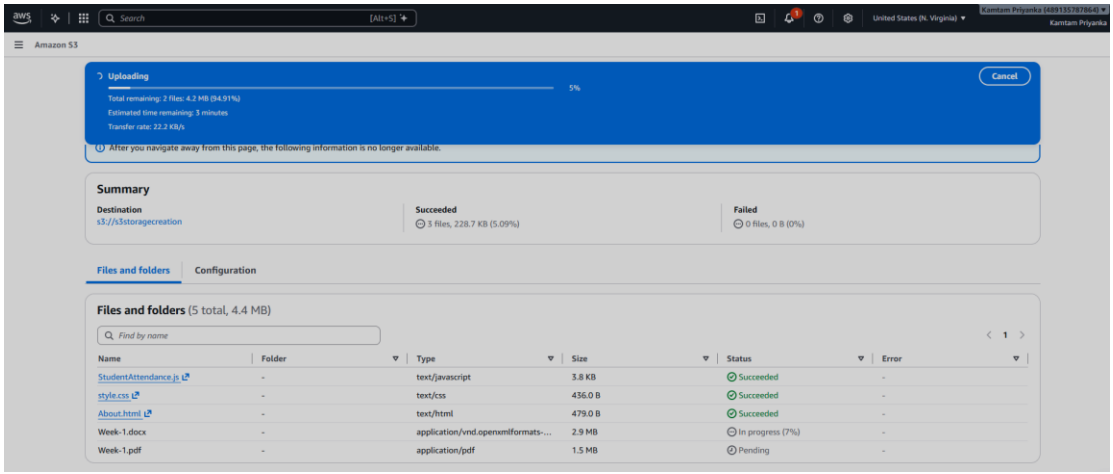

3. Bucket is created

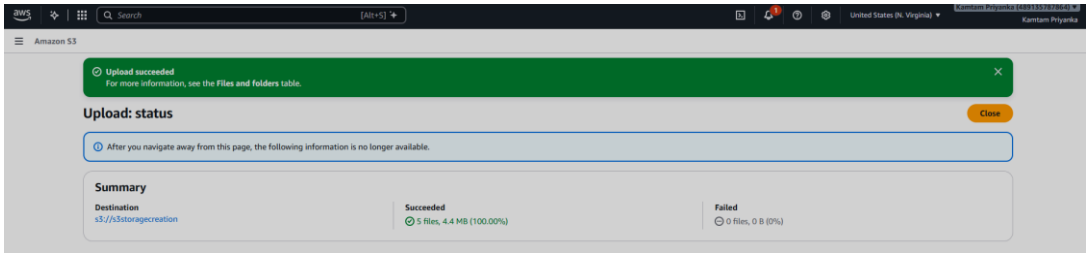

4. Upload different types of files and folders.

5. Wait until all the files ae uploaded

6. Upload successful

7. This way we can create storage for different files and folders using S3
